

Press Release

Fire direction computer from ATM ComputerSysteme for the demonstrator program of a future upgraded MARS/MLRS-system

ATM ComputerSysteme shipped to the industrial consortium for the demonstrator phase "Future Firecontrol computer" its militarized Notebook COMMANDER with the integrated Communication processor KM1.

The protocol software ADLER for the communication with the Artillery C³I-System is implemented on the KM1.

As a comfortable user interface a 15" TFT display with touch input function is additionally linked. The chosen products were approved in the ongoing field trials "Feldversuch 2000" on various vehicle platforms. This again demonstrates clearly a de facto cross-sectional application of ATM's product family.

ATM COMMANDER notebooks with integrated communication processor were already ordered by two other Nato countries.

Beside the ADLER-protocol the international ASCA-standard protocol was installed on the KM1-modul. The shipped systems will be linked with the each national digital VHF-radios.
