Contract for the vehicle main computer system within the FENNEK Program

ATM ComputerSysteme was awarded an important contract by Krauss-Maffei Wegmann for the delivery of the vehicle main computer system within the Dutch/German FENNEK Program.

The FENNEK will be fielded by both Armies as their future Reconnaissance Vehicle.

The vehicle computer is designed on ATM's VME-bus technology and follows the specific installation conditions. The operating system is a realtime-based solution with an ADA-runtime organization.

The vehicle is interfaced with numerous vehicle-specific sensors, e.g. for the navigation system, the optronic sensor module, and other mission-relevant data signals. The processed data are presented to the relevant mission support systems within the vehicle via interface.

ATM's computer was selected due its flexible design and convincing maintenance concept for the entire vehicle life cycle. This contract very distinctly underlines ATM's competence in vehicle-specific computer solutions.
